

THE LOWDOWN ON GMOS

Most GMOs have been engineered to withstand direct application of an herbicide (Roundup) and/or an insecticide

Most developed nations require labeling of GMOs or ban them completely (that's over 60 countries)...but the US has no restrictions of any kind

Health issues associated with GMOs include the potential for new or increased allergies, cancer, antibiotic resistance, autoimmunity, more

Herbicide-tolerant crops allow for far more use of pesticides - meaning more pesticide remaining on the foods YOU EAT!
